

Human Organs Study Guide

I. Vocabulary Matching

Brain

Lungs

Stomach

Skin

Heart

II. Identification

The human body is made up of many organs that work together. The **muscles** are attached to the **skeleton** to help the body move. To get the energy to move, the body needs food. This is first broken down in the stomach before it moves into the **intestines**. Digestive juices created by the **liver** and **pancreas** assist in this process. Liquid waste is filtered out of the blood by **kidneys** and is then removed from the body through the **bladder**.
